

Color in Brand Execution

Color Engine

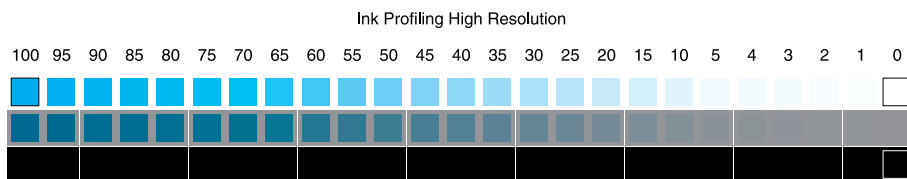

Color consistency is critical in brand recognition. Defining accurate brand and spot color standards is the first step in maintaining consistency. The next step is using these color standards in all packaging design and production applications.

Key benefits

- **Consistency:** maintain color consistency in brand execution
- **Flexibility:** make color critical decisions anywhere in the supply chain
- **Predictability:** know at the design stage what the result will be on press
- **Accuracy:** profile, control and simulate spot colors from design to proof/print

Accurate brand and spot color matching

The combination of unique spot color profiling and spectral ink modeling provides absolute accuracy and predictability for spot color simulation.

Proofing optimized for brand packaging

Brand packaging makes extensive use of designer (spot) colors. Having an accurate proof early in the life cycle sets the correct expectations and optimizes print production, avoiding costly errors and waste. FlexProof/E provides color-accurate contract proofing to a selection of inkjet printers.

Centralized color data

The Color Engine is a central color database for all color critical packaging data. In combination with the color database, The Color Engine Pilot provides the perfect tool set for creating and maintaining critical brand colors, creation of spot color profiles and other color conversion settings. The Color Engine maintains consistency throughout a production environment by ensuring every application and operator works with the same color critical data.

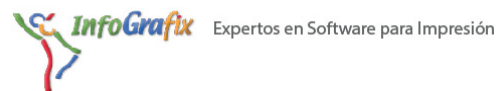

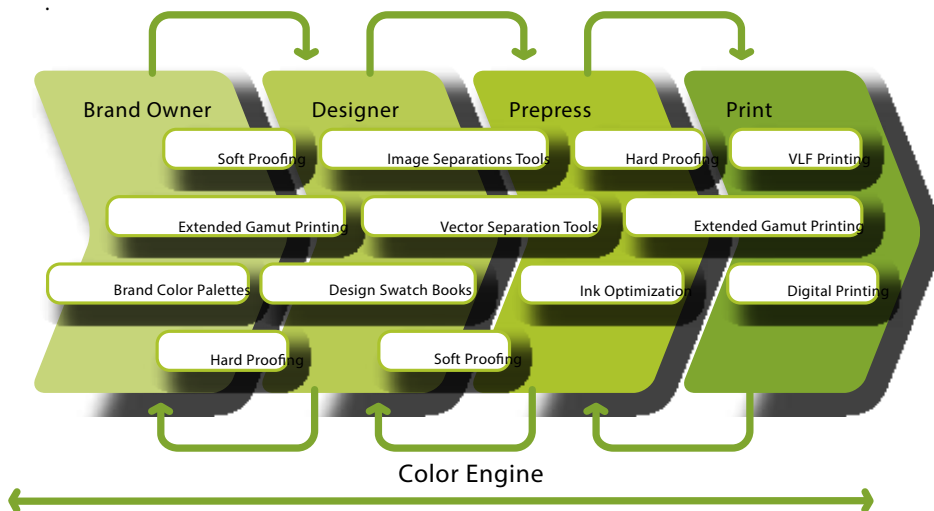

Share color data

As in a production environment, we also need to share color data throughout the packaging supply chain. We already share files, fonts, images and production specifications. We also need to share the critical color information that goes along with the brands and packaging.

Everyone works with the same data

The Color Engine provides brand owners, designers, prepress and converters access to the same color information.

Everyone needs access to the same color information. The goal is to create an environment of color predictability, allowing us to make the necessary color critical decisions.
